

Topic 6 - Tool Governance Assessment

AI Job Application Assistant | Web Search Tool Usage & Governance

Custom GPT	AI Job Application Assistant
Tool Enabled	Web Search
GitHub Repository	ai-job-application-assistant-tool-governance
Loom Demonstration	https://www.loom.com/share/cfd7f407d87b428d91c1bada246aa63b
Assessment Result	7/7 PASS

1. Assessment Objective

This assessment demonstrates the configuration and governance of a Web Search tool within the AI Job Application Assistant. It defines explicit trigger rules, non-trigger rules, fallback behavior, and validation scenarios for appropriate tool usage.

2. Tool Configuration

Enabled capability: Web Search

Web Search is used only when the request requires current, live, external, or online information that cannot be reliably answered from the uploaded Knowledge Guide or information already provided by the user.

3. Tool Governance Rules

Trigger Rules

- Use Web Search when the user explicitly asks to search the web.
- Use it for current company information, current job opportunities, current job-market information, time-sensitive information, or external webpages/job postings that require web access.
- Use it when current external research is necessary for an otherwise uncovered question.

Non-Trigger Rules

- Do not use Web Search when the answer is already covered by the Knowledge Guide.
- Do not use it for information already available in the conversation, resume, or job description.
- Do not use it for simple writing, rewriting, formatting, or explanation.
- Never use Web Search simply because it is available.

Fallback Behavior

- Clearly tell the user when Web Search fails, returns no useful result, or is unavailable.
- Do not guess or invent missing information.
- Use available Knowledge Guide or conversation information when sufficient.
- Otherwise ask the user to provide the required source or information.
- Never claim that a search was completed when it was not.

4. Validation Tests

Test 1 - Tool Required

Prompt: Search the web and find the current official careers page and latest publicly available information about OpenAI's current job opportunities. Summarize the relevant information and provide the sources.

Expected: Web Search should be triggered because the request requires current external information.

Observed: The GPT used Web Search and provided current OpenAI careers information and sources.

PASS

Test 2 - Tool Not Required

Prompt: According to the Knowledge Guide, what are the three skill-match classifications?

Expected: Web Search should NOT be triggered because the answer is already covered by the uploaded Knowledge Guide.

Observed: The GPT answered directly using the Knowledge Guide and identified Match, Partial Match, and Missing. No external web research was required.

PASS

Test 3 - Fallback Behavior

Prompt: If Web Search fails, returns no useful results, or is unavailable, what should you do?

Expected: The GPT should clearly explain the limitation, avoid guessing or inventing information, use available Knowledge Guide or conversation information when sufficient, and otherwise ask the user to provide the required source or information.

Observed: The GPT correctly described the fallback behavior and explicitly stated that it should not invent information or falsely claim that a search was completed.

PASS

5. Final Validation Checklist

Requirement	Result
Web Search enabled	PASS
Trigger rule defined	PASS
Non-trigger rule defined	PASS
Fallback rule defined	PASS
Tool-required scenario tested	PASS
Non-tool-required scenario tested	PASS
Fallback scenario tested	PASS

Final Result: 7/7 PASS

6. Deliverables

- Tool governance rules documented in the GPT instruction block.
- test_examples.md containing tool-required, non-tool-required, and fallback validation results.
- Loom demonstration of configuration and testing.

- GitHub repository containing the assessment deliverables.

7. Challenges, Resolutions, and Assumptions

Challenge: Tool trigger accuracy had to distinguish requests that require live external research from questions already answerable from the Knowledge Guide.

Resolution: The instructions explicitly require checking the Knowledge Guide and conversation context before deciding whether Web Search is necessary, and prohibit unnecessary tool calls.

Assumptions: The Knowledge Guide is authoritative for the assistant's documented processes and definitions. User-provided resume information remains authoritative for personal background, while a supplied job description remains authoritative for job-specific requirements.
